2. Data Summary
3. EDA and feature engineering
4. Feature Selection
5. Preparing dataset for modeling
6. Applying Model
7. Model Validation and Selection
8. Conclusion

Problem Statement :

The problem statement is to predict the price range of mobile phones based on the features available (price range indicating how high the price is). Here is the description of target classes :

- 0 - Low cost Phones
- 1 - Medium cost phones
- 2 - High cost phones
- 3 - Very High cost phones

This will basically help companies to estimate price of mobiles to give tough competition to other mobile manufacturer.

Also, it will be useful for consumers to verify that they are paying best price for a mobile.

Data Summary :

- **Independent Variables :**
- **Battery_power -** Total energy a battery can store in one time measured in mAh
- **Blue -** Has bluetooth or not
- **Clock_speed -** speed at which microprocessor executes instructions
- **Dual_sim -** Has dual sim support or not
- **Fc -** Front camera mega pixels
- **Four_g -** Has 4G or not
- **Int_memory -** Internal Memory in Gigabytes
- **M_dep -** mobile depth in cm

Data Summary:

- **Mobile_wt** - Weight of mobile phone
- **N_cores** - Number of course of processor
- **Pc** - primary camera mega pixels
- **Px_height** - Pixel Resolution Height
- **Px_width** - pixel resolution width
- **Ram** - random access memory in megabytes
- **Sc_h** - Screen height of mobile in cm
- **Sc_w** - Screen width of mobile in cm
- **Talk_time** - Longest time data single battery charge will last when you are

Data Summary:

Three_g - Has 3G or not

Touch_screen - Has touch screen or not

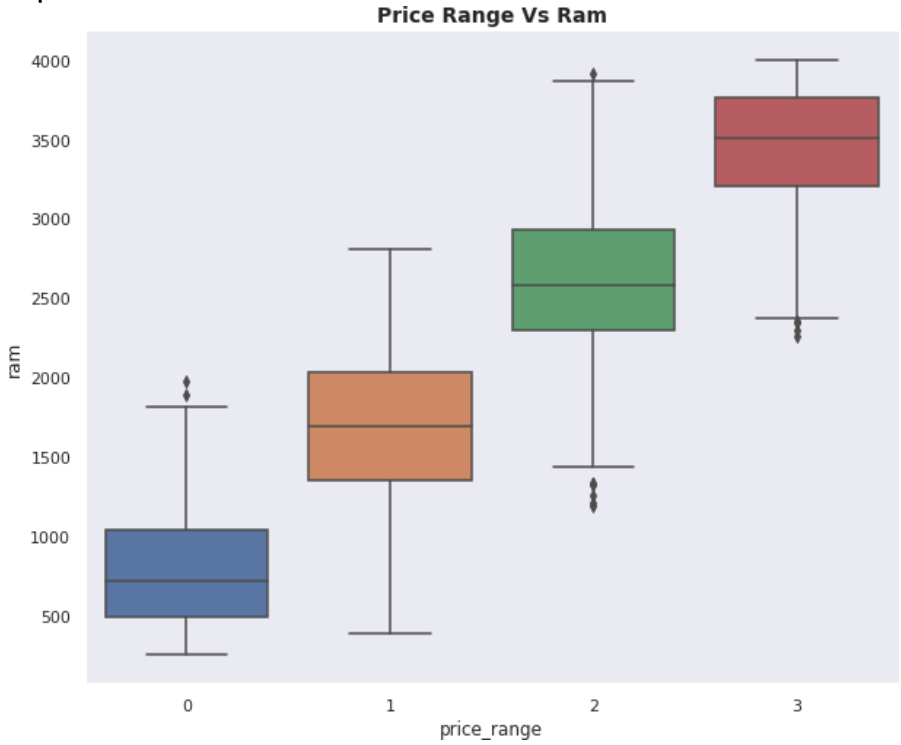
Wifi - Has wifi or not

Dependent variables :

Price_range - This is the target variable with value of
0 (low cost) ,
1 (medium cost) ,
2 (high cost) ,
And 3 (very high cost) .

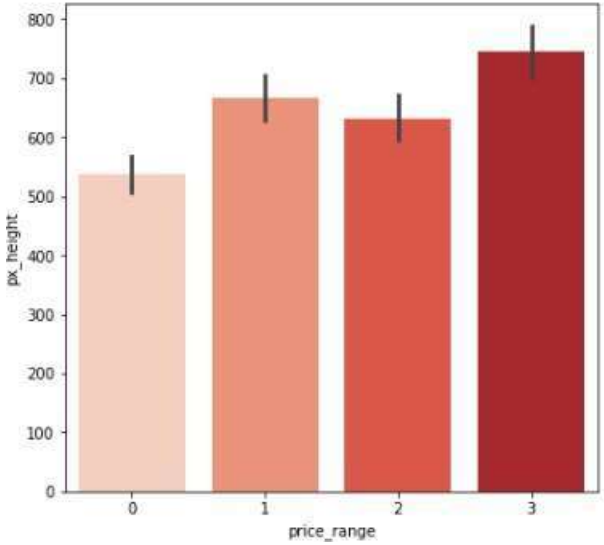
EDA and Feature engineering Relation Between Price Range & Ram :

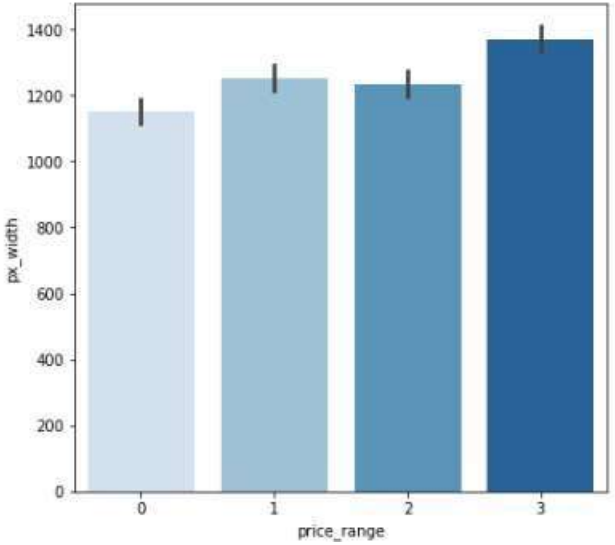
- This is a positive relationship, with increase in RAM, price too increases. There are 4 types of price range
- Type 1(low cost): RAM ranges between 216 to 1974 megabytes
- Type 2(medium cost): RAM ranges between 387 to 2811 megabytes
- Type 3(high cost): RAM ranges between 1185 to 3916 megabytes
- Type 4(very high cost): RAM ranges between 2255 to 4000 megabytes



Relationship between the Price Range and Pixel Height/ Width :

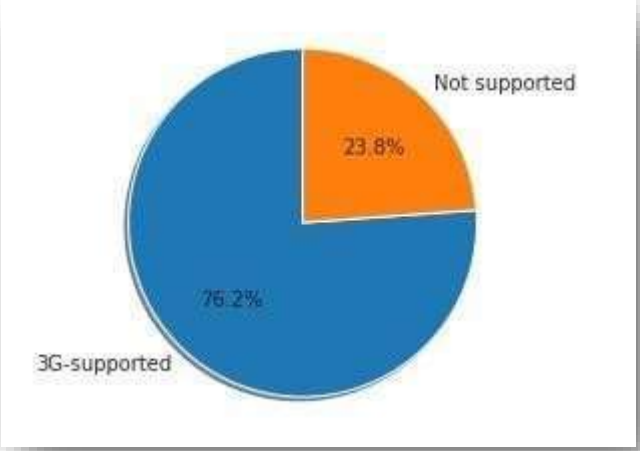
- From the above bar plot, we can see that the average pixel height and width are highest for the price range 3(very high cost).
- Low-cost phones have smaller average pixel width and pixel height.
- We can observe from this Bar plot that pixel height and pixel width are roughly equal in

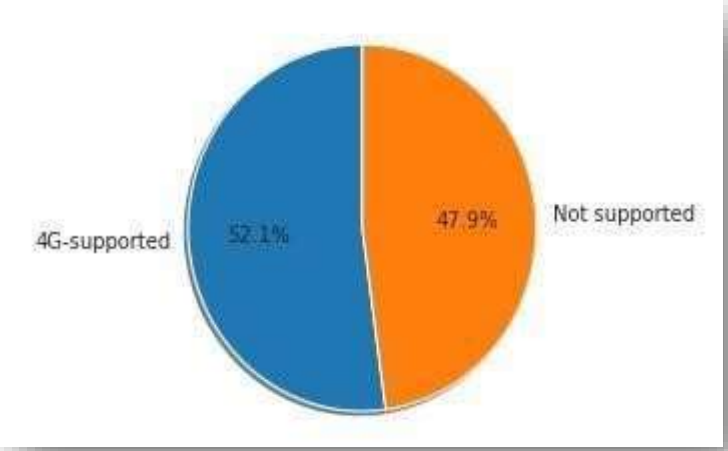




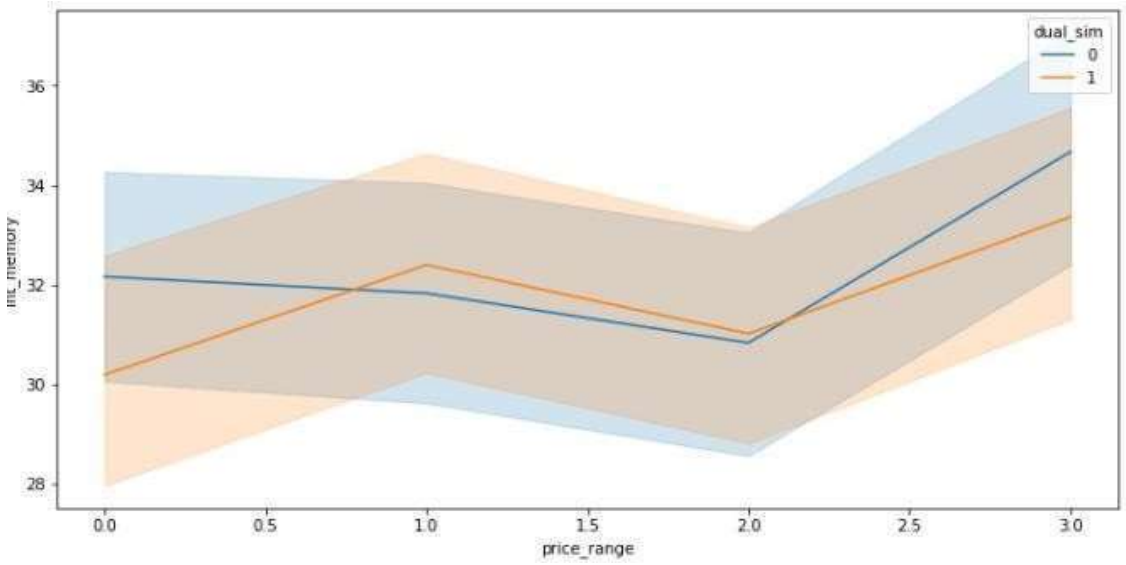
Exploratory Data Analysis :

- **3G-4G supported and Non-supported**





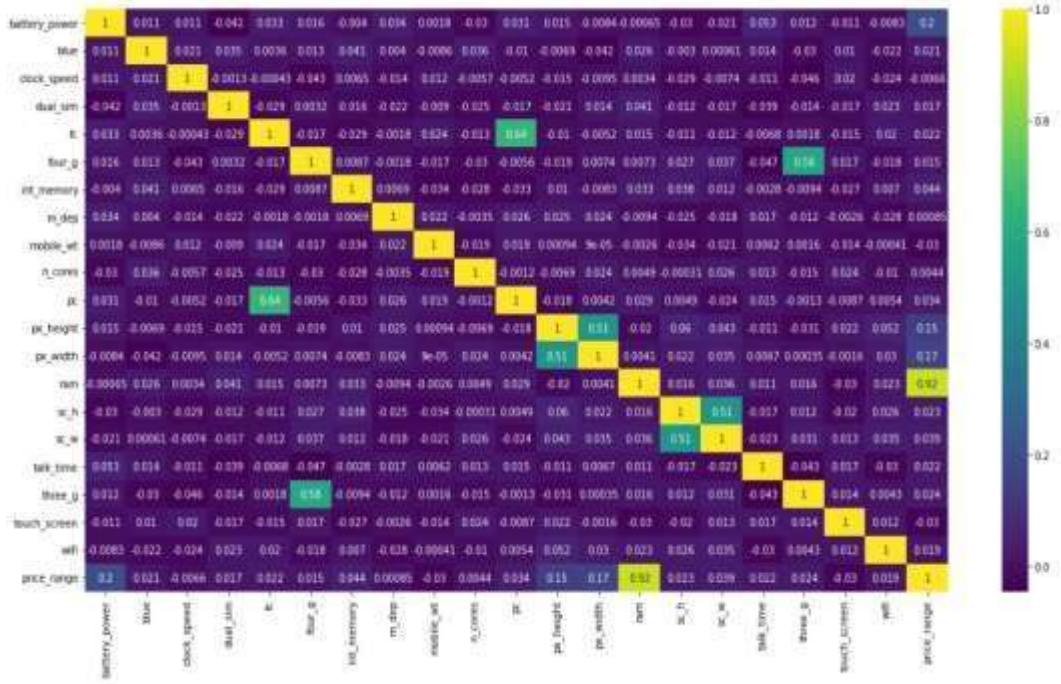
Multivariate analysis – int_memory , mobile_wt :



- There is drastic increase in internal memory for vey high prices.
- Also there is drastic Decrease in mobile weight for very high price.

Multivariate analysis :

- Pc is correlated with Fc.
- px_height and px_width are moderately correlated.
- Sc_h and sc_w are moderately correlated.
- Ram is highly correlated with price_range.



Preparing dataset for modeling:

Task : multiclass classification
Train set : (1340 , 20)
Test set : (660 , 20)
Response : 0-1-2-3

battery_power	blue	clock_speed	dual_sim	fc	four_g	int_memory	m_dep	mobile_wt	n_cores	pc	px_height

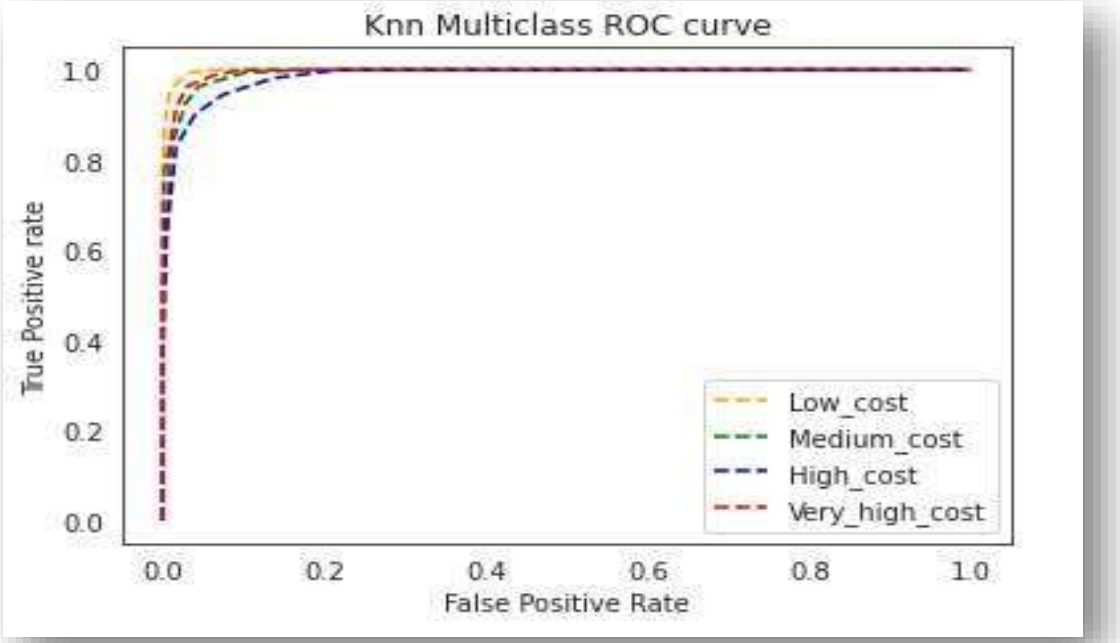
Applying Model

Implementing KNeighbours Classifier

TPR(True Positive rate) = TP/(TP+FN)

FPR(False Positiverate) = FP/(FP+TN)



Implementing KNeighbours Classifier :

Model Validation & Selection contd…

Observations:

1. As seen in the above slides Random forest classifier is not giving great results , Gradient Boosting Classifier is bit better than Random forest in recall and precision

2. XGboost classifier is giving the better results than GB but the recall of random forest classifier is somewhat similar

3. KNeighbors is giving the best results among all of the algorithms

4. Logistic regression is giving low results among all of them

Model Validation & Selection contd…

So we had chosen Kneighbors classifier for the prediction and the best hyperparameters obtained are as below

Best hyperparameters :
Train : (algorithm='auto', leaf_size=30, metric='Euclidean', metric_params=None, n_jobs=None, n_neighbors=11, p=2, weights='distance')

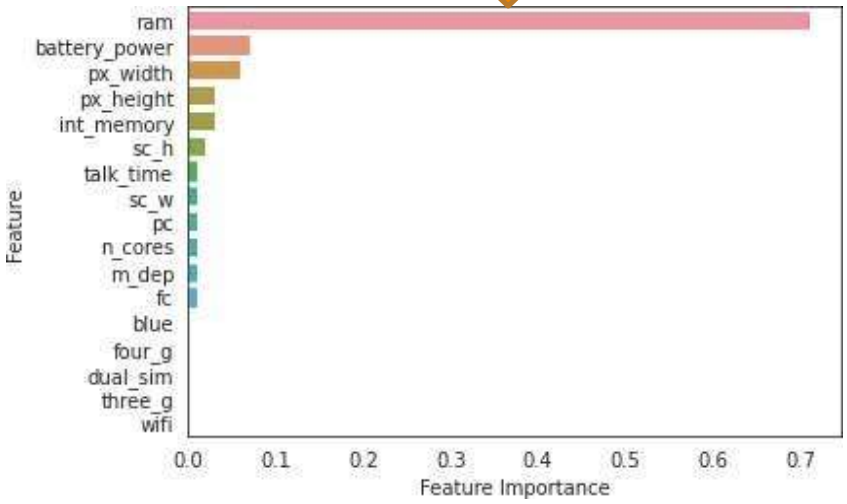
Test : (algorithm='auto', leaf_size=30, metric='euclidean', metric_params=None, n_jobs=None, n_neighbors=17, p=2, weights='distance')

Model Validation & Selection (Hyperparameter tuned):

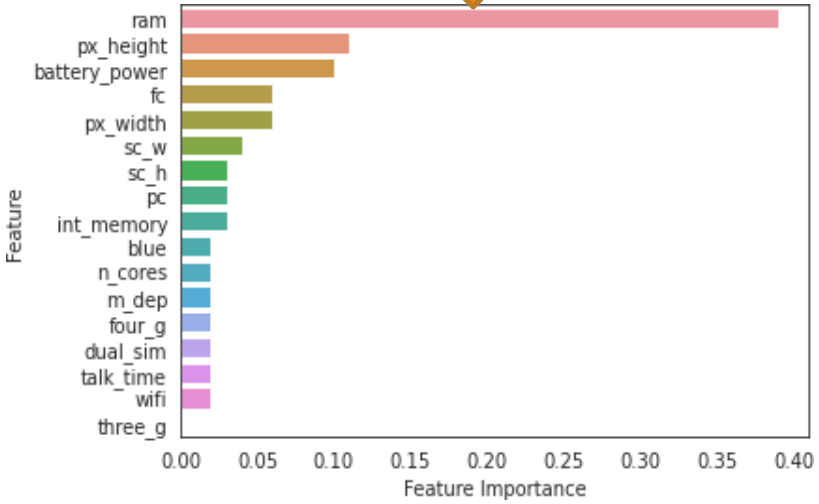
	precision	recall	f1-score	support
0	0.95	0.99	0.97	228
1	0.90	0.92	0.91	212
2	0.92	0.85	0.88	229
3	0.93	0.94	0.93	228
accuracy			0.92	897
macro avg	0.92	0.92	0.92	897
weighted avg	0.92	0.92	0.92	897

Feature Importance:

Random Forest Classifier



XGBoost Classifier



Conclusion :

- Ram , Battery_power features were found to be the most relevant feature for predicting price range of mobiles and dropping negative correlation features which are clock speed , mobile_wt , touch_screen .

- Kneighbors and Xgboost are given best accuracy score 95 % test , 93 % train and 91 % train , 88 % test respectively and roc_auc score for kneighbors is 99 % .

- Tuning the hyperparameters by GridSearch CV on kneighbors but not getting much difference in results but the best parameters n_neighbors for train and test are 11 and 17

Conclusion :

- So we conclude that kneighbors classifier is giving the best results for these dataset

- So we can say that in the price range prediction as the ram and battery power increases the price range will increase for sure

Thank You
